           "Identification of glycoprotein 330 as an endocytic receptor for apolioporotein J/Clusterin.";

"Identification of glycoprotein 330 as an endocytic receptor for apolioporotein J/Clusterin.";

"Identification sinds specifically clusterin with high affinity, but also ligands in common with other family members: plasminogen, extracellular matrix components, plasminogen activator inhibitor type I complex, apolioporotein E-enriched activator inhibitor type I complex, apolioporotein E-enriched beta-VLDL, iloporotein lipase, lactoferrin and calcium.

"FUNCTION: Receptor-mediated uptake of polybasic drugs such as aportinin, aminoglycosides and polymyxin B (By similarity).

"I- FUNCTION: My participate in regulation of parathyroid-hormone and para-thyroid-hormone-related protein release.

"FUNCTION: My participate in regulation of parathyroid-hormone and para-thyroid-hormone-related protein release.

"SUBDINIT: Forms a multimeric complex together with a receptor-associated protein (RAP). Binds to ankyrin-repeat family A protein complex together with a receptor-associated protein (RAP). Binds to ankyrin-repeat family A protein proximal thinles
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. "The receptor for yolk lipoprotein deposition in the chicken oocyte.";
J. Biol. Chem. 266:18761-18770(1991).
-!- FUNCTION: Binds VLDL and transports it into cells by endocytosis.
In order to be internalized, the receptor-ligand complexes must first cluster into clathrin-coated pits. Binding to Reelin induces tyrosine phosphorylation of Dabl and modulation of Tau
                                                                                                                              ogatus gatus (turtosu).

-!- FUNCTION: Binds VLDL and transports it into cells by endocytosis.
-!- FUNCTION: Binds VLDL and transports it into cells by endocytosis.
In order to be internalized, the receptor-ligand complexes must first cluster into clathrin-coated pits. Binding to Reelin induces tyrosine phosphorylation of Dabl and modulation of Tau phosphorylation (By similarity).
-!- SUBUNI: Binds to the extracellular matrix protein Reelin (By

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Proteins with anticoagulant and/or serine protease inhibitory activity isolated from nematodes and useful to inhibit blood coagulation.

Claim 10; Page 144; 243pp; English.

Proteins with anticoagulant and/or serine protease inhibitory activity, isolated from nematodes, are useful to inhibit blood coagulation. The proteins can be added to blood collection tubes defining the collection of mammalian plasma. They are also useful to prevent or inhibit thrombosis, and may be given alone or in combination with other therapeutic or in vivo diagnostic agents. The proteins can serve as immunogens to raise antibodies for use in the diagnosis and

```
identification of NAP concn. levels in biological fluids, e.g. to detect mammalian infection with a parasitic worm. They can also be used as immunogens in prophylactic and therapeutic vaccines against parasitic worm infection. The proteins may double the clotting time of human plasma in activated partial thrombin time assays when present at 10-50 nMol, and double the clotting time of human plasma in activated partial thrombin time assays when present at 10-100 nMol. The anticoagulant proteins are pref. derived from Ancylostoma caninum, A. ceylanicum, A. duodenale, Necator americanus or Heligomosmoides polygyrus. The proteins pref. have 2 NAP domains and specifically inhibit the catalytic activity of the factor VIIa/FF complex in the presence of factor Xa or a catalytically inactive factor Xa deriv, do not specifically inhibit the activation of factor VIIa in the absence of TF and do not specifically inhibit prothrombinase. Proteins given in AAR91720-R91732 are preferred subsequences of a generic NAP sequence. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 5 AA;

Screening an isolated protein for Nematode-extracted Anticoagulant Protein domains.

Disclosure; Col 151; 197pp; English.

The present sequence represents a nematode extracted anticoagulant protein (NAP) fragment. The protein has activity as an anticoagulant and/or serine protease inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TF selective inhibitory activity. The RESULT 2

which is found in all nematode-extracted anticoagulant proteins (NAPs). Proteins of this kind have been shown to be effective at preventing blood collection without causing excessive bleeding. They can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated

present sequence is a fragment of the NAP domain (see AAB15347)

Claim 3; Col 285; 197pp; English.

ö method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPTT) assay; calculating prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a PT to apt prolongation ratio, where a ratio at least one is indicative of factor VIIa/TP inhibitory activity. The method is useful for determining if a protein has factor VIIa/TP inhibitory activity New cDNA molecule encoding a protein having factor Xa inhibitory activity for preventing and treating blood clotting disorders, comprises nematode-extracted anticoagulant protein domains. Nematode-extracted anticoagulant protein; NAP domain; blood clotting; canine hookworm; thrombosis; vaccine. therapeutic or in vivo diagnostic agents. The proteins can serve as immunogens to raise antibodies for use in the diagnosis and confidential conform of NAP concor. Levels in biological fluids, e.g. to detect mammalian infection with a parasitic worm. They can also be used as immunogens in prophylactic and therapeutic vaccines against parasitis worm infection. The proteins may double the clotting time of human plasma and the conformance of the conformance of human plasma in activated partial thrombin time assays when present at 10-50 nMol, and double the clotting time of human plasma in activated partial thrombin time assays when present at 10-10 nMol. The anticoagulant proteins are pref. derived from Ancylostoma caninum, A. ceylantcum, A. duodenale, Necator americans or specifically inhibit the catalytic activity of the factor americans of in the presence of factor Xa or a catalytically inactive factor Xa deriv, do not specifically inhibit the activation of factor VIIa in the Companion of Sare preferred subsequences of a generic NAP concerns of sequence. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                          ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a nematode extracted anticoagulant protein (NAP) fragment. The protein has activity as an anticoagulant and/or serine protease inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The

specification describes a method for screening an isolated protein at least one domain for factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a sassay and an ex vivo activated protein in an ex vivo prothrombin time (PT) assay, assay and an ex vivo activated partial thromboplastin time (aPT) assay, calculating prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold debation of clotting time relative to a baseline clotting value, where a PT to abt and apt as deemed a two-fold elevation; and calculating ap TT to appropriation ratio, where a ratio at a least one is indicative determining if a protein has factor VIIa/TF inhibitory activity. The method is useful for

                                                                                                                                                                                                                                                                                               g
```

New cDNA molecule encoding a protein having factor Xa inhibitory activity for preventing and treating blood clotting disorders, comprises nematode-extracted anticoagulant protein domains.

Claim 4; Col 286; 197pp; English.

```
The present sequence is a fragment of the NAP domain (see AAB15347), which is found in all nematode-extracted anticoagulant proteins (NAPS). Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. They can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutanceus transluminal coronary angiophisty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequences can also be used for this) or as diagnostic tests. The proteins can also be used as vaccines against nematode parasites
                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 protein (NAP). The protein has activity as an anticoagulant and/or serine protease inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIA/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIA/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo

Proteins of this kind have been shown to be effective at preventing blood colotting without causing excessive bleeding. The proteins can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherossis which any beadial indraction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated
activated partial thromboplastin time (aPTT) assay, calculating prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation, and calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New cDNA molecule encoding a protein having factor Xa inhibitory activity for preventing and treating blood clotting disorders, comprises nematode-extracted anticoagulant protein domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nematode-extracted anticoagulant protein; AcaNAP31; AcaNAP42; AcaNAP46; canine hookworm; blood clotting; thrombosis; vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    protein (NAP). The protein has activity as an anticogulant and/or serine protein (NAP). The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo prolongation of clotting effected by the isolated protein in activated partial thromboplastin time (aPTT) assay; calculating prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation; and calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of
intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequence can also be used for this) or as diagnostic tests. The proteins can also be used as a vaccine against nematode parasites. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Moyle M;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Screening an isolated protein for Nematode-extracted Anticoagulant
Protein domains.

The present sequence represents a nematode extracted anticoagulant protein (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein contains at least one NAP domain which protein entered to a selective inhibitory activity for factor VIIA/TP. The specification describes a method for screening an isolated protein at least one domain contained action of the section vIIA/TP. Selective inhibitory activity. The method comprises determining the time to clotting affected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activity assay, calculating prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, which respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation; and calculating a PT to approach or ratio, where a ratio at least one is indicative of factor VIIa/TF inhibitory activity activity activity activity activity activity activity activity. The method is useful for determining the protein has factor VIIa/TF inhibitory activity
                                                                                                                       ö
factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory activity
                                                                                                                     Gaps

Sequence 82

```
The present sequence is the Ancyclostoma ceylanicum nematode-extracted anticoagulant protein AceNAP4d2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by mematodes or as diagnostic tests. The protein can also be used as a vaccine against nematode parasites. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New cDNA molecule encoding a protein having factor Xa inhibitory activity for preventing and treating blood clotting disorders, comprises nematode-extracted anticoagulant protein domains.

RESULT 13
           4AY30425
                     The present sequence is the Ancyclostoma ceylanicum nematode-extracted anticoagulant protein AceNAP4d2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes or as diagnostic tests. The protein can also be used as a vaccine against nematode parasites. (Updated on 06-AUG-2003 to correct os
                                                                                                                                                                                                                                                                                                                                                                                                                                            New cDNA molecule encoding a protein having factor Xa inhibitory activity for preventing and treating blood clotting disorders, comprises nematode-extracted anticoagulant protein domains.
                                                                                                                                                                                                                                                                                                                                                                                           Moyle M;
                                                                                                                                               A. ceylanicum nematode-extracted anticoagulant protein AceNAP4d2 #2.
                                                                                                                                                                  Nematode-extracted anticoagulant protein, AceNAP4d2, blood clotting, canine hookworm; thrombosis, vaccine.

Screening an isolated protein for Nematode-extracted Anticoagulant Protein domains.

Disclosure, Col 137-138, 197pp, English.

```
The present sequence represents a nematode extracted anticoagulant protein (MAP). The protein has activity as an anticoagulant and/or serine protein in the protein has activity as an anticoagulant and/or serine protease inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification of cestibes a method for screening an isolated protein at least one domain for factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo profuncembin time (PT) assay and an ex vivo protongation of clotting effected by the isolated protein in each of the PT and apTT assay, with respect to a baseline clotting value for each cassay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation; and calculating a PT to apTT prolongation ratio, where a ratio at least one is indicative of factor VIIa/TF inhibitory activity activity activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

protein (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein has activity as an anticoagulant and/or serine protease inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/Fr. The specification for for factor VIIa/Fr. The specification of the for factor VIIa/Fr. The specification of the for factor VIIa/Fr selective inhibitory activity. The method comprises of electmining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (FT) assay and an ex vivo activated partial thromboplastin time (aPFT) assay, calculating prolongation of clotting effected by the isolated protein in each of the prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation; and calculating a FT to appropriation ratio, where a ratio at least one is indicative of factor VIIa/Fr inhibitory activity. The method is useful for determining if a protein has factor VIIa/Fr inhibitory activity.
The present sequence represents a nematode extracted anticoagulant

The present sequence represents a nematode extracted anticoagulant protein (NAP). The protein has activity as an anticoagulant and/or serine protean (NAP). The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIA/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIA/TF selective inhibitory activity. The method comprises determining the time to clotting affected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (APT) assay and an ex vivo crivated partial thromboplastin time (APT) assay and ex vivo prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting value, where a doubling of aptT prolongation ratio, where a ratio at least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

phosphoserine aminotransferase XF2126 (imported] - Xylella fastidiosa (strain 9a5c)
C;Species: Xydella fastidiosa
C;Bate: 18-Aug-2000 #sequence_revision 20-Aug-2000 #text_change 02-Sep-2000
C;Accession: C82572
R;anonymous, The Xylella fastidiosa Consortium of the Organization for Nucleotide Sequen
Nature 406, 151-157, 2000
A;Title The genome sequence of the plant pathogen Xylella fastidiosa.

Title: Perfect score: Sequence:

BLOSUM62 Gapop 10.0 , Gapext 0.5 Scoring table:

141681 seqs, 52070155 residues Searched:

141681 Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt\_42:\* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Proc. Natl. Acad. Sci. U.S.A. 100:7877-7882(2003).

T. FUNCTION: Has both an apurinic and/or apyrimidinic endonuclease

activity and a DNA N-glycosylase activity. Incises damaged DNA at

C. FUNCTION: The Complete Gly similarity).

C. CATALYTIC ACTIVITY: The C.O-P bond 3' to the apurinic or

apyrimidinic site in DNA is broken by a beta-elimination reaction,

Leaving a 3'-terminal unsaturated sugar and a product with a

coloration of the complete colorate which is not important for the

FUNCTION: Has both, an apurinic and/or apyrimidinic endonuclease activity and a DNA N-glycosylase activity. Initiates repair at cis-syn pyrimidine dimers. Proceeds via an imino enzyme:DNA intermediate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 10-0CT-2003 (Rel. 42, Created)

Sinorhizobium meliloti strain 1021.",
Proc. Natl. Acad. Sci. U.S.A. 98:9877-9882(2001).
-! CAPALYTIC ACTIVITY: ATP + 5-phospho-D-ribosylamine + glycine = ADP
-! PATHWAY: De novo purine biosynthesis; second step.
-! SIMILARITY: Belongs to the GARS family.
Phosphoribosylamine--glycine ligase (EC 6.3.4.13) (GARS) (Glycinamide ribonucleotide synthetase) (Phosphoribosylglycinamide synthetase).
PURD OR ROBSS OR SWC00933.
Rhizobium meliloti (Sinorhizobium meliloti).
Bacteria, Proteobacteria, Alphaproteobacteria, Rhizobiales, Rhizobiaceae; Sinorhizobium/Ensifer group; Sinorhizobium.

1. J. Mol. Biol. 242:599-603(1994).

1. CATALYTIC ACTIVITY: ATP + L-tryptophan + tRNA(Trp) = AMP + diphosphate + L-tryptophanyl-tRNA(Trp).

2. Giphosphate + L-tryptophanyl-tRNA(Trp).

3. SUBUNIT: Homodiamer (By similarity).

Nature 377:162-165(1995).

-!- FUNCTION: Involved in DNA excision repair. May play a part in DNA damage recognition and/or in altering chromatin structure to allow access by damage-processing enzymes.
-!- SUBDURIT: HETERODIMER OF A 125 kDa SUBUNIT (P125) AND OF A 58 kDa SUBUNIT (P58).
-!- SUBCELLULAR LOCATION: Nuclear (Probable).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

Sequence 700, Application US/08465380

Patent No. 5863894

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: George P. Vlasuk, Patric H. Stanssens,

APPLICANT: Yes R. Laroche, Laurent S. Jespers,

APPLICANT: Yes R. Laroche, Laurent S. Jespers,

APPLICANT: Peter W. Bergum

TITLE OF INVENTION: NEMATODE-EXTRACTED ANTICOAGULANT

TITLE OF INVENTION: PROTEIN

NUMBER OF SEQUENCES: 356

CORRESPONDENCE ADRESS:

ADDRESSE: Lyon & Lyon

STREET: 633 West Fifth Street

STREET: 633 West Fifth Street

STREET: Los Angeles

STATE: California

COUNTRY: U.S.A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   COUNTRY: 0.0....

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New bone morphogenetic fusion proteins - comprising a purification tag and a bone morphogenetic active fragment, used for enhancing wound healing or bone growth.

Claim 8; Page 34; 64pp; English.

The present peptide represents a proteinase site used in the creation of the bone morphogenetic fusion proteins of the invention. The bone morphogenetic fusion protein may contain some or all of the following elements: a purification tag, a proteinase site, an ECM/bone binding site, a second proteinase site, and a bone morphogenetic protein active fragment. The fusion proteins of the invention also includes proteins that have transforming growth factor beta active fragments instead of bone morphogenetic protein active fragments. The bone morphogenetic

The present sequence is a conantokin peptide derivative, which can be used to treat neurologic and psychiatric disorders, e.g. as an anticonvulsant, neuroprotective or analgesic agent. Neurologic and psychiatric disorders include epilepsy, convulsions, neurotoxic injury (associated with conditions of hypoxia, anoxia or ischaemia, which trynially follow stroke, cerebrovascular accident, brain or apinal cord trauma, myocardial infarct, physical trauma, drowning, suffocation, perinatal asphyxia or hypoglycemic events), neurodegeneration (associated with Albfehiem's disease, senile dementia, Amyotrophic lateral Sclerosis, Multiple Sclerosis, Parkinson's disease, Huntington's disease, Down's Syndrome, Korsakoff's disease, schizophrenia, AlDS disease, but and neuronal damage dementia, multi-infarct dementia, Binswanger dementia and neuronal damage associated with uncontrolled seizures), chemical toxicity (such as addiction, and morphine, opiate, opioid and barbiturate tolerance), pain (acute, chronic, migraine), anxiety, major depression, manic-depressive
                                                                                                                                                                                                                                                                                                                  ö
